Serum testosterone and the subsequent course of behavioral arousal in females. This study examined the role of testosterone in arousal-related changes in cognitive performance in humans. Serum testosterone concentrations were assessed in 96 women, who were tested on the Stroop Color Word Test (SCWT) immediately following a blood draw. Women with higher levels of testosterone showed increased cognitive flexibility as measured by the SCWT but only when they were tested immediately following a blood draw. These results suggest that women's subsequent performance on the Stroop f3e1b3768c
