CLOUD security is an excellent form of protection for your business. This technology provides an extremely versatile way of protecting your web applications and data. But let's face it, web applications are not created equal. In this article we're going to take a look at some of the finer details that developers need to consider when adding security to their applications. Introduction First of all, let's take a moment to figure out what is, and is not, really secure. There's no single password that will solve all your security problems. But there is a lot that you can do to help you keep your system from being vulnerable in the first place. Security is far more than just making sure that the user name and password is secure. When a malicious attacker attempts to access your system, they are generally expecting you to use weak and easily guessed passwords. With a good password system in place you'll deter attackers. For example, using special numbers and characters is recommended. You should also make sure that you force your users to change their passwords when they log in. There are, however, some other things that developers can do to add another level of security to their applications. Encrypting All Your Data In the past, an encrypted password provided about the same

System Requirements:
