Support for non-linear geometry and extensions to the drawing model OpenGL rendering and scripting support Graphics libraries support Decoding and encoding XML Dynamic loading and unloading of user add-ins and extended features Tools Tools are tools which enable users to perform more tasks or a particular task quicker than would be possible with a keyboard or mouse. They can be stand-alone programs that do not require an AutoCAD session or they can be add-ons that run within AutoCAD or in a separate window. Although all tools have an associated menu which is normally accessible by a keyboard command or right-click, users may also invoke them by selecting a command under a menu item or selecting a button or an icon in the ribbon toolbar. Productivity features AutoCAD has a number of features that aim to streamline the working process, including: Guided drawing. This feature allows AutoCAD to draw a series of geometric shapes (for example, rectangles, lines, arcs, circles) and guides to show the user the best way to draw the shapes. The user can start drawing without worrying about moving or scaling objects or going to the right place on the paper. This feature is similar to the concept of blue lines in Microsoft Office programs. Snap. AutoCAD's snap feature allows the user to define how objects will be snapped to the grid. The user can adjust the distance between snaps, and move the snapping window along the grid. This makes it easier to move objects when they overlap other objects, and to snap objects to a specific grid location. Keep. The keep feature allows the user to define certain points of an object's boundary, and automatically snap objects to these points when the user makes a move, or a cut or a rotate. Properties. A variety of properties (also called attributes) can be used to control objects within a drawing. Viewing options. There are various view types that can be selected from the view properties, which include all, by type, by layer, by status, and so on. The user can also specify a view to display on the screen while the current drawing is saved to a file. Deletion and redraw. The delete feature allows the user to remove objects from the drawing. If the objects have been created in different sheets, they will be removed from all of the sheets. Objects can also be deleted after they are no longer used. The redraw feature allows the user to easily view 5b5f913d15
