L-Arginine, the substrate of NO-synthase, and L-lysine, its product, act as precursors of N-Nitroso compounds. Toxic effects of L-arginine and L-lysine, 2,4-diamino-5-hydroxymethylpyridine (DHMMP) on the survival of embryos of the fruit fly Drosophila melanogaster were studied. 0.5 mM L-arginine and 0.4 mM DHMMP reduced the survival of the embryos by 20 and 30%, respectively, during 10 days of the embryogenesis. The duration of the action of L-arginine was significantly longer than that of DHMMP. The mechanisms of toxicity of the compounds were studied in vitro. DHMMP produced DNA single-strand breaks in the cell-free system of DNA excision repair, although only 0.05 mM DHMMP was required for the effect. L-Arginine had no effect on the survival of embryos, but at 1 mM concentration it inhibited the activity of DNA excision repair. This effect was abolished by the simultaneous addition of 0.1 mM NADH. a1d647c40b
