Picture editing software is much the same as computer software in general. The amount of knowledge of the computer language required to use the software will be much less than for, say, a word processor. Typically, however, the best image editing software will give you more capabilities than you need to do your editing. If you're like the rest of us, you can't sit through a tutorial that teaches you to edit a batch of images. But with lots of practice, you'll become adept at using Photoshop's toolbars and menus. The Retouch Lens The Retouch Lens (the "L" button) is Photoshop's tool for touch-ups of an image. The Retouch Lens has a few tools that you can use to smooth out a particular portion of an image that's not quite right. Get to know the Retouch Lens's spot healing tool. The Spot Healing tool replaces specific pixels with a color you specify. This tool has several settings that enable you to work with relatively large or small areas to correct small problems, such as a scratch on your image or a small text or logo that may be misplaced. The Spot Healing tool's Color Sampler tool is designed to give you control over the color of the affected area. By clicking a point on the image, the color of the retouched pixels is determined by the color you select. To learn how to use the Spot Healing tool, see the next section for step-by-step instructions. The first time you use the Retouch Lens, you'll have a hard time deciding what to choose for the spot color. After you make a few test strokes in an image, you'll come up with a palette you can follow. Selecting a Target Color To use the Spot Healing tool, you have to select a target color, which is the color you want to use to replace the pixels that are out of place. The Brush icon in the Spot Healing tool's dialog box has a tooltip that states, "Select color for spot healing." You can use any color in your image, but then you won't be able to specify exactly what the color does (that is, whether the pixels are filled, for example). Before you use the Spot Healing tool, you must select a spot color. The Spot Healing tool has several options in its dialog box that allow you to do so: Color Sampler: This option enables you to choose a color from the image

How to use Adobe Photoshop Elements to edit images With Adobe Photoshop Elements, you can edit images in one of two ways. The first way is to open an existing image with the click of a button. If your image is stored on the computer, you can drag it onto the canvas or you can click the File menu and select Open with Photoshop Elements. This will open the image in the document window. You can use the tools to edit the image as usual, and then save the edited file either as a new file or by saving it into the existing file. The second way to use Photoshop Elements is to open a new image. Click the File menu and select Open. When prompted, click the type of file that you want to open. If you are only opening an image, click the browse button and navigate to the file you want to open. You can also use the Edit menu to make changes in the image. The tools in the toolbox can be used with or without a selected tool. Adobe Photoshop Elements is an excellent graphic editor that can be used in a wide range of artistic projects. With a little practice, you can design posters, photographs, cartoon characters, or even logos. You can also use Photoshop Elements to create unique emoticons for your online chat room, including your initials and pet names, or even make your own emoji. How to edit images in Adobe Photoshop Elements Working with images in Photoshop Elements is similar to working with images in Adobe Photoshop. You can add, delete, and edit layers to change a photo's size, shape, background, and color, and you can crop the image to remove unwanted areas. To add a layer, click the New button at the bottom of the Layers palette and select Layers from the list. You can add new layers all over your image. Layers are organized on a layer-by-layer basis. You can click and drag the layers to reposition them on top of each other, and to change the stacking order. You can also hide or show layers by selecting them. To do this, click the eye icon next to a layer and select Hide Layers, or click the eye icon next to a layer and select Show Layers. To delete a layer, double-click the layer and select Delete. Once you have edited a layer, you can use the Selection menu to convert it to a new layer or make a selection on the a681f4349e

(window, document); } })(); }); })(); }); A: You should look into using a jQuery UI File Upload Plugin or something similar. The jQuery File Upload Plugin is probably best for your situation, but there are a number of other options. For example, let me know if you are interested in a couple of additional jQuery plugins that I use on my own site. A: As you are using jQuery 1.6 (and I assume jQuery UI as well), try the jQuery File Upload version 1.8.1: A: Here's my 1st attempt at uploading any file to an server via JavaScript! I had to google on how to upload with HTML5... At least I learned a lot while implementing it! Q: Is there a way to order by the distance a property is present in a array in MongoDB and Express? I have the following documents in my MongoDB: { _id: 1, possibleOptions: [{ optionID: 1234, value: "foo" }, { optionID: 3456, value: "bar" }, { optionID: 7891, value: "fred" }, { optionID: 45, value: "joe" }] } { _id: 2, possibleOptions: [{ optionID: 3456, value: "bar" }, { optionID: 1234, value: "foo" }, { optionID: 45, value: "joe" }] } And I want to order my documents by how close optionID is to optionID in all possibleOptions arrays. (Note that the first document has optionID: 1234 present in the first possibleOptions array, while the second document has optionID: 3456 present in the first possibleOptions array. They are not adjacent, but to find a document with optionID: 1234 and another document with optionID: 3456, I want to know that 1234 and 3456 are close to each other). Is there a way to achieve this in MongoDB or in Express? If it's possible, please provide some guidelines. A: There are a couple of things you can do here. First, you can group() by _id and order() by optionID. db.collection.group({_id: 1}, {optionID: 1}, {optionID: 2},
