3. In the top-left corner of your Photoshop toolbox, click Window to open the window, and choose Layers, where you can manage your layers (see Figure 6-1). Photoshop keeps a history of your work, so don't lose any work, even if you close the window, don't save the file, or shut down your computer while working on a project. You can always return to the image and continue at your leisure. FIGURE 6-1: In the Layers window, you can open and close layers or resize them in their respective toolbars. The Photoshop layers are numbered from 1 to the total number of layers in the document. The top-most layer is layer 1. If you don't have any layers, the Layers window may display 0 layers. When you're done working on the image, click outside the Layers window to close it. A transparent grid helps you make sure that the image background isn't visible when you resize or move a layer. You can find it on the Layers window's View tab, as shown in Figure 6-2. The Layers window is also where you create and save a new document and import a background image. The Layers window is similar to the Image Zone in the old Photoshop 4.x program. FIGURE 6-2: The Layers window shows your layers. Creating a new document It's so easy to start an image with just a single layer: Simply create a new document and then simply drag a new layer on top. Photoshop, however, helps you build a more useful image by letting you create layers and divide your projects into sections, which makes it easy to keep track of just one part of the image as it changes in different ways. Here are a few other considerations in creating a new document: * If you already have a file saved on your computer, you may want to overwrite the existing file with the new one. To do so, right-click the existing file and choose Open as Copy, as shown in the margin. Then choose File⇒Save to save the file, and choose File⇒Open to open the new file. * After you're done editing the layers in the Layers window, select all the Layers layers by clicking the little box at the bottom of the Layers window. Then right-click and choose Create Document to jump right

1. Field of the Invention The present invention relates generally to a method for manufacturing semiconductor devices, and more particularly to a method for manufacturing semiconductor devices to use the bottom surface of a metal organic chemical vapor deposition (MOCVD) wafer for a gate electrode in a semiconductor device. 2. Description of the Prior Art In recent years, in the course of constructing integrated circuits on a semiconductor substrate, a semiconductor device having a multi-layer electrode structure has come to be a mainstream. In the manufacturing process of the semiconductor device, a gate electrode of a metal oxide semiconductor (MOS) transistor or a gate electrode of an insulated gate bipolar transistor (IGBT) is generally formed by MOCVD or the like. FIG. 15 shows a pattern process of the gate electrode. As shown in FIG. 15, trenches 101 are formed for separation into N-type field effect transistors 102N and P-type field effect transistors 102P by a photolithographic and etching technique. Then, gate electrodes 103N, 103P are formed on the upper surface and the lower surfaces of the trenches 101 by MOCVD. Thereafter, after layers 106N, 106P as a source and a drain are formed, the layers 106N, 106P are subjected to a photolithographic technique, thus gate electrodes 107N, 107P are formed on the upper surfaces of the layers 106N, 106P. In the above-described method for forming the gate electrode, the bottom of the trench 101 is covered with an insulating film 104 made of SiO₂ or the like, and the gate electrode 103N, 103P is formed on the upper surface and the lower surface of the trench 101. On the other hand, the gate electrode 107N, 107P is formed on the upper surface of the layers 106N, 106P and the lower surface of the insulating film 104. However, in the above-described method, since the sidewall surfaces of the insulating film 104 are as steep as 100.ANG., for example, when wet etching is effected on a silicon layer 105 provided between the gate electrode 107N and the gate electrode 107P, the silicon layer 105 is also etched away. As a result, the gate electrode 107N, 107P and the insulating film 104 are partially etched away, and shortcircuiting occurs between the gate electrode 107N, 107P and the silicon layer 105. Consequently, a leakage
